Executive summary of recommendations

Details of recommendations can be found in the main text at the pages indicated.

Management of common cold (acute viral rhinosinusitis) and use of antibiotics in acute bacterial rhinosinusitis

_Acute viral rhinosinusitis (common cold)_

A Antibiotics are not recommended for treatment of the common cold in children or adults (pg 17).

Grade A, Level 1++

A Dextromethorphan should be considered as a treatment option for adults with cough caused by the common cold (pg 17).

Grade A, Level 1++

A Topical (intranasal) or oral nasal decongestants, used for up to three days, is recommended for adolescents and adults with the common cold (pg 17).

Grade A, Level 1+

A Topical ipratropium may be considered as a treatment option for nasal congestion in children older than six years and in adults with moderate to severe common cold (pg 18).

Grade A, Level 1+

A Codeine and other narcotics, dextromethorphan, anti-histamines, and combination anti-histamine/decongestants are not recommended to treat cough or other cold symptoms in children (pg 18).

Grade A, Level 1++
First-generation anti-histamines and combination anti-histamine/decongestants may be considered for cough and cold symptoms in adults if the benefits outweigh the adverse effects (pg 18).

Grade A, Level 1++)

Vitamin C, zinc, and Echinacea are not recommended for active treatment of common cold due to lack of effectiveness in preventing the common cold (pg 18).

Grade A, Level 1++)

Use of antibiotics in acute bacterial rhinosinusitis

Adults

Antibiotics are not recommended for adults with non-severe acute bacterial rhinosinusitis (mild pain and temperature < 38.3 degrees centigrade) till after 10 days of symptoms from onset (pg 18).

Grade A, Level 1+

Besides severity of illness, the patient’s age, general health, cardiopulmonary status, and co-morbid conditions should be considered in deciding start of antibiotic treatment in patients with acute bacterial rhinosinusitis (pg 19).

Grade D, Level 4

The first-line empiric antibiotic for adults with acute bacterial rhinosinusitis is amoxicillin. If the patient is allergic to amoxicillin, trimethoprim-sulfamethoxazole or macrolides may be used (pg 19).

Grade A, Level 1+

For adults with acute bacterial rhinosinusitis, the recommended duration of appropriate oral antibiotic regime is 7 days. Clinician assessment after 7 days is recommended. Antibiotic regime can be extended to 14 days if patient’s symptoms fail to resolve (pg 19).

Grade A, Level 1++)

A second-line antibiotic such as high dose amoxicillin-clavulanate, ampicillin-sulbactam or fluoroquinolone should be considered in adults with acute bacterial rhinosinusitis if there is no clinical response after at least 7 days of first line antibiotics (pg 19).

Grade B, Level 2+
Children

Appropriate antibiotic regimes are recommended for children with the following conditions:
1. Non-severe acute bacterial rhinosinusitis: In a child with protracted symptoms with asthma, chronic bronchitis or acute otitis media.
2. Severe acute bacterial rhinosinusitis: In ambulatory patients, an oral antibiotic resistant to beta-lactamase enzymes (amoxicillin-clavunate or a second generation cephalosporin such as cefuroxime axetil).
3. Severe illness or toxic condition: In a child with suspected or proven suppurrative complication.

Grade D, Level 4

Intravenous antibiotic effective against penicillin-resistant Streptococcus pneumonia, beta-lactamase producing Haemophilus influenzae and Moraxella catarrhalis should be used in children with severe acute bacterial rhinosinusitis (pg 20).

Grade D, Level 4

Amoxicillin (45 mg/kg/day, doubled if age under 2 years or with risk factors for resistance) is recommended for a child with non-severe acute bacterial rhinosinusitis with protracted symptoms. If the symptoms do not improve within 72 hours, an antibiotic against the resistant organism prevalent in the community should be considered. Azithromycin or clarithromycin as first-line therapy is recommended in penicillin allergy (pg 20).

Grade D, Level 4

Management of infective rhinosinusitis in adults

Acute rhinosinusitis

Other diagnosis should be considered in adults with acute rhinosinusitis who present with unilateral symptoms of bleeding, crusting, or cacosmia (pg 22).

Immediate referral to an ENT specialist is indicated for acute rhinosinusitis in adults who present with sinister signs indicative of complications of acute intermittent rhinosinusitis. These include:
- Peri-orbital oedema
• Displaced globe
• Double vision
• Ophthalmoplegia
• Reduced visual acuity
• Severe unilateral or bilateral frontal headache
• Frontal swelling
• Signs of meningitis or focal neurological deficits

(Grade D, Level 4)

Plain sinus x-rays are not recommended for the diagnosis of acute rhinosinusitis in adults (pg 23).

(Grade D, Level 4)

**Treatment of acute rhinosinusitis**

**D** Alleviate symptoms of mild acute rhinosinusitis in adults with the following options
• Decongestants
• Nasal saline spray and/or irrigation
• Antihistamines, only in patients with concomitant allergic rhinitis
• Analgesics

(Grade D, Level 4)

**D** Treat underlying inflammatory process of moderate to severe acute rhinosinusitis in adults with:
• Intranasal steroid
• Antibiotic, empiric: 7-14 days
Alleviate symptoms with the following options:
• Decongestants
• Nasal saline spray and/or irrigation
• Antihistamines, in patients with concomitant allergic rhinitis
• Analgesics

(Grade D, Level 4)

**GPP** The workgroup recommends that patients with acute rhinosinusitis should be reviewed for symptom resolution. Patients whose symptoms worsen or persist despite therapy should be referred to a specialist for further evaluation and management (pg 24).

**GPP**
Nasal steroid spray twice daily is recommended for adults with acute rhinosinusitis which has not resolved after 5 days of initial presentation (pg 26).

Grade A, Level 1+

Oral corticosteroids are not recommended for adults with acute rhinosinusitis (pg 27).

Grade A, Level 1+

Antihistamines are not recommended in the treatment of acute bacterial rhinosinusitis in adults (pg 27).

Grade D, Level 4

Antihistamines may be used as an adjunct to antibiotic treatment in acute bacterial rhinosinusitis patients with concomitant allergic rhinitis (pg 27).

Grade A, Level 1+

New generation oral antihistamines are preferred in adults with acute rhinosinusitis for their favourable efficacy/safety ratio and pharmacokinetics. Refrain from first generation antihistamines to avoid sedation and anticholinergic side effects (pg 27).

Grade D, Level 4

Topical decongestants may be used for adults with acute rhinosinusitis whose symptoms fail to resolve after 10 days of initial presentation (pg 27).

GPP

The duration of treatment with topical decongestants should be limited to less than 10 days to avoid rhinitis medicamentosa (pg 28).

GPP

Nasal hypertonic saline irrigation, alone or in conjunction with other adjunctive measures, may be used to reduce symptoms and medication use in adults with frequent acute rhinosinusitis (pg 28).

Grade A, Level 1+

Mucolytics are not recommended to be prescribed routinely for adult patients with acute rhinosinusitis (pg 29).

Grade D, Level 4
**Chronic rhinosinusitis**

**GPP** All adults with persistent and recurrent rhinosinusitis should be referred to a specialist for nasal endoscopy to assess for differential causes (pg 30).

**GPP** Other diagnosis should be considered in adults with chronic rhinosinusitis who present with unilateral symptoms of bleeding, crusting, or cacosmia (pg 30).

**D** Immediate referral to an ENT specialist is indicated for chronic rhinosinusitis in adults who present with sinister signs such as:
- Peri-orbital oedema
- Displaced globe
- Double vision
- Ophthalmoplegia
- Reduced visual acuity
- Severe unilateral or bilateral frontal headache
- Frontal swelling
- Signs of meningitis or focal neurological deficits.

(pg 31)  
**Grade D, Level 4**

**D** Sinus x-rays are **not** recommended to support the diagnosis of chronic rhinitis in adults (pg 31).

**Grade D, Level 4**

**Treatment of chronic rhinosinusitis without nasal polyps**

**D** For chronic rhinosinusitis without nasal polyps, alleviate symptoms with the following options:
- Nasal saline irrigation

Treat underlying inflammatory process with:
- Intranasal steroid
- Antibiotic, in patients with acute exacerbation of chronic rhinosinusitis, culture directed: 10-14 days (pg 33)

**Grade D, Level 4**

**C** Short-term oral antibiotics are recommended for acute exacerbation of chronic rhinosinusitis without nasal polyps (pg 33).

**Grade C, Level 2**
A Nasal corticosteroids may be prescribed for chronic rhinosinusitis without nasal polyps (pg 33).

Grade A, Level 1+

A Nasal saline irrigation may be prescribed for chronic rhinosinusitis without nasal polyps (pg 34).

Grade A, Level 1+

GPP Oral steroids, oral/topical decongestants, mucolytics or antihistamines are not recommended in treatment of chronic rhinosinusitis without nasal polyps (pg 34).

GPP

Treatment of chronic rhinosinusitis with nasal polyps

D For chronic rhinosinusitis with nasal polyps, alleviate symptoms with the following options:

• Nasal saline irrigation
• Anti-histamines, in patients with concomitant allergic rhinitis

Treat underlying inflammatory process with:

• Intranasal steroid.

(pg 35)

Grade D, Level 4

GPP Adults with chronic rhinosinusitis with nasal polyps should be reviewed for symptom control. Patients whose symptoms worsen during or persist despite therapy should be referred to a specialist for further evaluation and management (pg 35).

GPP

C Short-term oral antibiotics are recommended to improve symptoms in acute exacerbation of chronic rhinosinusitis with nasal polyps (pg 36).

Grade C, Level 2+

C Long-term, low-dose macrolide therapy may be considered for chronic rhinosinusitis patients with nasal polyps (pg 36).

Grade C, Level 2+

GPP Management by a specialist is recommended for patients with chronic rhinosinusitis with nasal polyps being prescribed long term, low dose macrolide therapy, in view of its side effects (pg 36).

GPP
A Nasal corticosteroid therapy may be used in adults with chronic rhinosinusitis with nasal polyps (pg 36).

Grade A, Level 1+

C Antihistamines are not recommended in chronic rhinosinusitis with nasal polyps (pg 37).

Grade C, Level 2+

Management of infective rhinosinusitis in children

GPP Allergic rhinitis often coexists with paediatric acute and chronic rhinosinusitis. The history should evaluate for symptoms of allergic rhinitis and identify possible allergens (pg 39).

GPP

GPP Otoscopy should be performed routinely to exclude otitis media in paediatric acute and chronic rhinosinusitis (pg 40).

GPP

D Plain X-ray is not recommended routinely to confirm the diagnosis of rhinosinusitis in children (pg 40).

Grade D, Level 4

A Topical corticosteroids may be used in children as an adjunct to antibiotics. It can reduce the cough and nasal discharge earlier in acute bacterial rhinosinusitis (pg 43).

Grade A, Level 1+

GPP Topical decongestants should be used in children no longer than 4-5 days to avoid toxicity and rhinitis medicamentosa (pg 43).

GPP

D Saline nose drops or sprays may be considered to decrease the mucus trapping and crusting associated with acute rhinosinusitis in children (pg 43).

Grade D, Level 3
D The workgroup recommends antibiotics use only in acute exacerbation of paediatric chronic rhinosinusitis, by following the recommendations from the Consensus Meeting in Brussels, 1996:

- For chronic rhinosinusitis, especially with frequent exacerbations, 2 weeks of oral antibiotics is advised. The antibiotic is changed if there is no response within 5-7 days.
- Failing this, sinus secretions for culture or investigations to exclude recalcitrant causes are considered.
- If there is slow response, a second 2-week course can be prescribed.
- In rare cases with clear-cut improvement but persisting symptoms, a 3rd course can be given before surgery is considered.
- Parenteral antibiotic may be appropriate if oral antibiotics fail.

(44)

Grade D, Level 4

C Nasal douching may be considered for paediatric chronic rhinosinusitis (pg 44).

Grade C, Level 2+

D Antral lavage, inferior meatal antrostomy (except possibly in primary ciliary dyskinesia), Caldwell-Luc operation (risks damage to un-erupted teeth) are not recommended in paediatric chronic rhinosinusitis (pg 45).

Grade D, Level 3

Management of allergic rhinitis

GPP The diagnosis of allergic rhinitis should be made based upon concordance between a typical history of allergic symptoms and diagnostic tests (pg 48).

GPP

D The workgroup recommends using the algorithm for the diagnosis and assessment of severity of allergic rhinitis proposed by ARIA 2008 (refer to Figure 6) (pg 48).

Grade D, Level 4
Figure 6  Symptoms of allergic rhinitis

(Adapted with permission from ARIA 2008 Update)

GPP Besides a nasal examination for allergic rhinitis, look out for:
• Ocular signs of irritation e.g. allergic conjunctivitis; redness and rubbing of eyes indicative of itchiness.
• Chest examination to rule out concurrent asthma.
  (pg 49)

D The workgroup recommends using the algorithm for the classification of allergic rhinitis proposed by ARIA 2008 (refer to Figure 7) (pg 49).

Grade D, Level 4

Figure 7  Classification and severity of allergic rhinitis

(Reproduced with permission from ARIA 2008 Update)
The workgroup recommends using the algorithm for the management of allergic rhinitis proposed by ARIA 2008 (refer to Figure 8) (pg 50).

Figure 8  Algorithm for management of allergic rhinitis

(Reproduced with permission from ARIA 2008 Update)
**GPP** Mattress encasings or High Efficiency Particulate Air Filters for house dust mite and pet allergy in adults with rhinitis should be part of the overall management of allergic rhinitis (pg 52).

**A** Second-generation oral or intranasal H1-antihistamines are recommended for the treatment of allergic rhinitis and conjunctivitis in adults and children (pg 52).

*Grade A, Level 1++*

**A** Intranasal glucocorticosteroids are strongly recommended for the treatment of allergic rhinitis in adults and children (pg 52).

*Grade A, Level 1++*

**D** Intramuscular glucocorticosteroids and the long term use of oral preparations are not recommended for the treatment of allergic rhinitis due to safety concerns (pg 52).

*Grade D, Level 3*

**A** Topical H1-antihistamines are recommended for the treatment of allergic rhinitis and conjunctivitis. Its therapeutic effects are superior and faster than oral anti-histamines (pg 52).

*Grade A, Level 1+

**A** Intranasal ipratropium may be considered as a treatment option for rhinorrhea associated with allergic rhinitis (pg 52).

*Grade A, Level 1+

**A** Topical chromones should be considered as a treatment option for allergic rhinitis and conjunctivitis. However, they are only moderately effective (pg 53).

*Grade A, Level 1+

**A** Montelukast may be considered as a treatment option for seasonal allergic rhinitis and asthma in patients over 6 years of age. It should not be used more than 4 weeks since there is limited data of its efficacy in patients with persistent allergic rhinitis for more than 4 weeks (pg 53).

*Grade A, Level 1+

**C** Intranasal decongestants may be used for a short period of time in patients with severe nasal obstruction caused by allergic rhinitis (pg 53).

*Grade C, Level 2*
C Oral decongestants (and their combination with oral H1-antihistamines) may be considered in the treatment of allergic rhinitis in adults, but side effects are common (pg 53).

**Grade C, Level 2++**

**GPP** Education of patient and/or patient's carer on the management of allergic rhinitis should be considered as an option to maximize compliance and optimize treatment outcomes (pg 54).

**Paediatric aspects of allergic rhinitis**

**GPP** Symptoms of sneezing, nasal itching, discharge and congestion that persist longer than 2 weeks should prompt a search for a cause other than infection in children (pg 55).

**GPP** It is recommended to ask about family history of atopy and progression of atopy of the child (pg 55).

**GPP** Skin prick tests should be performed and interpreted reliably early in life (pg 55).

**Grade B, Level 2+**

**GPP** The principles of treatment are the same in children as in adults with allergic rhinitis, but dosages should be adapted and care should be taken to avoid the side effects involving impairment of growth and cognitive development (pg 56).

**GPP** Pharmacologic management for allergic rhinitis in children should be individualized and polypharmacy avoided (pg 56).

**GPP** Intranasal glucocorticosteroid with bioavailability of <1% such as fluticasone propionate or mometasone furoate should be considered as a treatment option for allergic rhinitis and allergic conjunctivitis (pg 56).

**Grade A, Level 1++**
Intranasal glucocorticosteroids with high bioavailability such as betamethasone should not be used in children with allergic rhinitis due to its effect upon growth and growth velocity (pg 56).

Grade B, Level 1++

Oral and depot glucocorticosteroid preparations should be avoided in children with allergic rhinitis due to negative effect on short term growth and growth velocity (pg 56).

Grade A, Level 1+

Second generation H1-antihistamines such as cetirizine, levocetirizine and loratadine should be considered as a treatment option in the treatment of allergic rhinitis in children (pg 57).

Grade A, Level 1+

Nasal saline drops or spray may be considered in children with allergic rhinitis to clear the nose before eating or sleeping (pg 57).

GPP

Sublingual immunotherapy (SLIT) should be considered in children above age 5 years who have poor symptomatic control of allergic rhinitis despite maximal therapy or who cannot or will not take medication (pg 57).

Grade A, Level 1++

The family and the child should be educated about the recurrent or persistent nature of the disease, allergen avoidance and avoidance of allergen triggers and respiratory tract irritants, the most important of which is tobacco smoke (pg 58).

GPP

Management of rhinitis in pregnancy

Nasal endoscopy on a decongested nose may be considered as an option to differentiate pregnancy rhinitis from sinusitis (pg 61).

Grade D, Level 4

Imaging studies are not recommended to make a diagnosis in rhinitis in pregnancy (pg 61).

Grade D, Level 4
Skin prick tests are not recommended for rhinitis in pregnancy because use of potent antigens in skin testing may be associated with systemic reactions (pg 61).

Grade D, Level 4

GPP In treating rhinitis of pregnancy, all drug therapy should ideally be avoided especially in the first trimester. If drug therapy cannot be avoided then treatment will depend upon the predominant symptoms, with the topical agents as first line since they have minimal systemic exposure (pg 62).

GPP

Cromones are safe with no known teratogenic effect but they are moderately effective. It may be given for the treatment of rhinitis in the first 3 months of pregnancy, 3-4 times daily (pg 62).

Grade C, Level 2+

C If cromones are ineffective and poorly tolerated, they should be replaced with anti-histamines. Chlorpheniramine and tripelennamine are the anti-histamines of choice for pregnant women with rhinitis. Cetirizine and loratadine may be considered after the first trimester (pg 62).

Grade C, Level 2+

C Intranasal steroids should be prescribed as an alternative to or in combination with anti-histamines for severe cases of rhinitis in pregnancy (pg 62).

Grade C, Level 2+

C Budesonide is the only recommended intranasal steroid for rhinitis in pregnancy (pg 62)

Grade C, Level 2+

C Topical decongestants like oxymetazoline may be considered as second-line therapy for short-term relief and when no other safer alternatives are available for the treatment of rhinitis in pregnancy (pg 63).

Grade C, Level 2+

C Oral decongestants are not recommended for rhinitis in pregnancy (pg 63).

Grade C, Level 2+
Leukotriene Modifiers are not recommended for allergic rhinitis in pregnancy (pg 63).

**Grade C, Level 2+**

Amoxicillin is the drug of choice for pregnant patients with rhinitis who are not allergic to penicillin (pg 63).

**Grade A, Level 1+**

Amoxicillin-clavulanate or cephalosporin may be given to pregnant women with rhinitis not responding to amoxicillin (pg 63).

**Grade D, Level 3**

Metronidazole should be used in rhinitis in pregnancy caused by anaerobic pathogens (pg 63).

**Grade C, Level 2+**

Immunotherapy is not recommended for rhinitis in pregnancy. However, it may be continued if the maintenance phase has been reached (pg 63).

**Grade D, Level 4**
